What is the Model Context Protocol (MCP)?

Copy page

MCP (Model Context Protocol) is an open-source standard for connecting AI applications to external systems.

Using MCP, AI applications like Claude or ChatGPT can connect to data sources (e.g. local files, databases), tools (e.g. search engines, calculators) and workflows (e.g. specialized prompts)—enabling them to access key information and perform tasks.

Think of MCP like a USB-C port for AI applications. Just as USB-C provides a standardized way to connect electronic devices, MCP provides a standardized way to connect AI applications to external systems.

What can MCP enable?

- Agents can access your Google Calendar and Notion, acting as a more personalized AI assistant.
- Claude Code can generate an entire web app using a Figma design.

Model Context Protocol

Why does MCP matter?

Depending on where you sit in the ecosystem, MCP can have a range of benefits.

- **Developers**: MCP reduces development time and complexity when building, or integrating with, an AI application or agent.
- **AI applications or agents**: MCP gives them access to an ecosystem of data sources, tools and apps, which enhances their capabilities and improves the end-user experience.
- **End-users**: MCP results in more capable AI applications or agents that can access user data and take actions on the user's behalf when necessary.

Broad ecosystem support

MCP is an open protocol supported across a wide range of clients and servers. AI assistants like **Claude** and **ChatGPT**, development tools like **Visual Studio Code**, **Cursor**, **MCPJam**, and many others all support MCP — making it easy to build once and integrate everywhere.
